ColorFlow device type for defining flexographic presses

ColorFlow software includes a device type for defining flexographic presses in the **Devices** palette. A flexographic press is a curve-controlled device type.

When you define a device condition for a **Flexographic Press**, specific features for setting up and proofing flexographic presses are enabled in the device condition and in color setups that use the device as the PCO or SCO. These features are described below.

Note: A flexographic press device condition cannot function as a color input for a color setup.

- Flexographic plate setups and curves
- Flexographic press device curves
- Discontinuous tonal response and colorimetric response
- Flexographic discontinuous device response
