Adding a spot ink to a print transfer curve

1. In the **Curve Channels** pane, below the **Spot Inks** table, click the **Add** button .
2. Click the **Name** column and enter the name of the spot ink, such as `PANTONE 236 C`. It's important that you enter the spot ink name exactly as its separation is named in the design file, or Prinergy will not apply the correct channel.
3. Double-click the **Color** column and choose a suitable color (for visual recognition only).
4. Click **Apply**.
