

Diagram: create jobs and process, move, and rename files using smart hot folders

Smart hot folders that create a new job and process, move, and rename files:

1. Accept the source file
2. Create a job with the target job name from the template job
3. Save it in the same group as the template job
4. Simultaneously copy, rename, and move the source file to any of the following locations:
 - A job-relative location
 - A folder on a mounted volume (including another smart hot folder)
 - Any job's hot folder
 - Multiple hot folders in the new job
