

Linking templates together to automate your workflow

To automate your workflow, link your process templates together using hot folders.

1. See [Creating a refine to PDF process template](#).
2. See [Creating process templates](#).
3. Create two hot folders, attaching the Refine to PDF process template to one hot folder and the output process template to the other hot folder. See [Creating a new single-process hot folder](#).
4. From the Process Template Editor dialog box, edit the refine to PDF process template you created.
 - a. In the **File Delivery** section select the **Send Processed Files to** option.
 - b. Click **Browse** to navigate to the output process template hot folder you created in step 3. See [Editing process templates](#).
5. See [Submitting files via hot folders](#).

Prinerger Evo refines the input file to PDF and saves it to the root of the output process template hot folder, which triggers Prinerger Evo to begin processing the refined PDF for output.
