Adding or changing color definitions while refining

Use this procedure when you want to add a color definition or change a color definition while you are refining. For example, you can use this procedure to adjust the screen angle of a color while refining.

- 1. Start a second refine, which is a refine process on refined files.

 You cannot add or change color definitions when you refine input files.
- 2. In the Start Process dialog box, click Color Mapping.
- 3. In the Color Mapping dialog box, identify whether the colors are defined in the color database.
 - A colored square indicates a color is defined. If the color is in a user library, you can change its
 definition. If the color is in a factory library, you can make a copy of it in a user library and change
 the copy.
 - An <u>A</u> icon indicates a color that is not defined in any of the factory color libraries or in the user libraries selected in the **Color Libraries** area of the **Spot Color Handling** section of the refine process template that you are using.

Tip: You can also select the color and read its description in the **Color Information** area.

- 4. Select a color in the Page Color column.
- 5. Perform any of the following actions:

То	Do This
Add an undefined color to the color database	 a. Click Add. b. In the Select a Color Library dialog box, in the Add the color recipe <color> to the library list, select a library. The libraries in the list are the user libraries selected in the Color Libraries area of the Spot Color Handling section of the refine process template that you are using.</color> c. Select either Global or Job <job name=""> to determine whether the color is available to all jobs or only to the current job.</job> d. Click OK.
Edit an existing color	 a. Click Edit. b. When prompted, click either Edit Color Recipe Globally to edit add a copy of the color definition to a global user library, or Edit Color Recipe For This Job Only to add a copy of the color definition to a job-specific user library.

6. In the Color Editor, set the options for the selected color, and click **OK**. If you added a color, the icon next to it changes from \triangle to a colored square. If you changed a color, the description in the **Color Information** area changes.
