

Security

This section is provided for information only and is not configured or supported by Kodak.

Securing the communication from your OPS instance to Prinerger and from Prinerger to your OPS instance are two different issues. To secure orders from the OPS instance to Prinerger, you must acquire an SSL certificate for a proxy server which you configure and run to handle connections originating at the OPS instance. The Prinerger primary server does not support incoming SSL connections (nor SSL certificates). To secure order status communication from Prinerger to the OPS instance, the OPS instance must have an SSL certificate. It can be the same certificate that you use to secure communications between your customers and your OPS instance.
