

Outputting PDF files with XMP tags

Prinerger supports PDF files with XMP tags from other workflow systems. These tags contain screening parameters per separation such as frequency, angle, and dot shape, which override the screen parameters set in the **Calibration & Screening** section of the output process templates.

Note: You must have a license for the XMP feature.

1. When refining such files, perform the following actions in the refine process template:
 - a. In the **Impose** section, select the **Treat Input Files as Flats** check box.
 - b. In the **Normalize** section, in the **XMP Tags Handling** section, select the **Preserve XMP Tags** option.
 - c. If you want to see the screening values from the XMP tags in the **Separations** view of Job Manager, select the **Populate XMP Tags to Custom Fields** check box. The values are displayed in the relevant columns (**SO_ANGLE; SO_DOTSHAPE, SO_HIGHLIGHT_CX, SO_HIGHLIGHT_SX, SO_SCREENRULING**) in the **Separations** view in Job Manager.

Note: The **Populate XMP Tags to Custom Fields** check box is available only if the **Treat Input Files as Flats** check box is selected in **Impose** section of the Process Template.

Note: The XMP tag values are not identical to the Prinerger values and are mapped to the equivalent Prinerger values in a CSV mapping file located in c:

\Prinerger\CreoAraxi\data\XMPTags. The values displayed in the **Separations** view are the Prinerger values.

You can use Excel or a text editor to edit the values in the `XmpMapping.csv` file to result in the desired screening output. For instance, you could edit the values for the "CS9" dotshape to result in Maxtone SX dotshape with the Maxtone SX CMYK 15-45-0-75 angle set, with Round 1 dot and a feature size of 4x4. Check the parameters available for each dotshape in Process Template editor, to make sure you are choosing valid parameters. Make sure that you save the file as .csv (text) format. In order to have Prinerger recognize any edits to the `XmpMapping.csv` file, you must start and stop all Register and Output/Proof JTPs in Administrator (UADM).

2. To output the job, in the output process template, in the **Calibration & Screening** section, in the **Screening Mode** section, select one of the following options:
 - a. **Honor DotShop and XMP settings from document**—if you select this option, any DotShop and XMP settings override the settings in the process template. DotShop settings override XMP settings since DotShop settings are object-related settings while XMP are separation-related settings.
 - b. **Honor DotShop, XMP and the following settings from the document**—if you select this option, any DotShop, XMP or PostScript Document Screening (SetHalftoneOperator) settings override the settings in the process template. DotShop settings override XMP and PostScript Document Screening settings, since DotShop settings are object-related settings, while XMP and PostScript Document Screening are separation-related settings. If the file contains PostScript Document Screening settings, you can selectively honor angle, frequencies and/or dot shape settings. However, you cannot disable any angle, frequency or dot shape settings specified by DotShop or XMP tags.
