

Software-installed factory color files

For your convenience, Kodak Proofing Software pre-installs separate sets of factory colors that you can use in the Color Database Editor.

- Several factory library files containing standard target L*a*b* color lists are included with each Proofer Client installation. You can import these files into Color Database Editor when creating the color libraries for which you will generate Approval donor recipes.
- A list of factory color libraries is pre-configured in the proofer controller's Color Database Editor, which the built-in Kodak Prinergy Evo software component uses to convert spot separations to process-color equivalents when imaging proofs.
