

Setting up additional proofers

License options are available for actively running more than one proofer.

Requirements:

- The license must support the number of proofers that can be active at the same time.
- The currently activated number of proofers must be one less than the license allows, to make room for the proofer that you are adding.

Note: Adding a proofer increases the demand on system resources and can affect performance.

To add another proofer, you follow the same sequence of tasks as for the first proofer in a new system.

- [Using the Add Proofer wizard to define a new Matchprint Inkjet proofer](#)
- [Preparing a proofer, media, and spectrophotometer for production proofing](#)
- [Calibrating the proofer and confirming operation](#)
