

Profiles created or used in ColorFlow software - MPI

Custom profiles created in ColorFlow software can be used in Kodak Proofing Software with the Open Connectivity Kit or via direct connectivity with Prinergy workflow software.

ICC device or DeviceLink profiles created in ColorFlow (or other software) can be imported into Proofer Administrator and signed for the Certified Process for Color Confirmation.

Export signed profiles for use in your workflow software. Exported profiles also can be imported into ColorFlow software for use with color setups.
