

# Installation and setup

To view and approve color-accurate elements, you must install the Matchprint Virtual software on your qualified Mac computer that uses a monitor that meets the requirements for Matchprint Virtual 9.2.

The Matchprint Virtual software calibrates and profiles the monitor and compares the results against an “ideal” profile for that monitor type.

For information about monitor requirements, see the *Monitor Selection Guide*.

**Important:** The Mac computer must have the correct video cards, available ports, and cables to support the recommended (maximum) resolution of the monitor.
