What you need to know 1

RBA uses customized rules to help you automate virtually every step of your workflow. RBA lets you automate routine tasks and create detailed automated workflows.

Rules definition

An RBA rule is an association between an event and an action. For example, when <this event> occurs, then perform <this action>. Events trigger actions in the Prinergy system. The RBA automation engine watches for events to happen and when they do, an action is triggered.

For example:

- When the event—**Input File Added**—occurs
- The action—**Refine Input File**—is performed

In this activity, you will create an RBA rule set that will automatically refine an input file after the input file is added to a Prinergy job.
