Estimating color response

You can estimate color response from an existing color response for the following device types:

- Offset Press - Sheetfed
- Offset Press - Heatset Web
- Offset Press - Coldset Web
- Flexographic Press

You can generate an estimated color response for a device condition if you have any of the following:

- The Color Characterization chart measurement for the same device in a similar device condition, called the original device condition
- The i1Pro measurement of the substrates of the original and new device conditions
- The estimated gain difference between the two substrates. You can manually enter the value during the estimation process

1. In a device condition in the viewer window, click the Measurements icon  next to a device.
2. Click the **Measurements** tab.
3. Below the **Active Measurement** area, click **Estimate**.
4. In the **Response Estimation** dialog, select an original device condition.
   You can also select Current Device Condition to edit the existing device condition response.
5. Follow the wizard to generate the estimated color response.
