

Final Output process template

At the top of the dialog box is the **Output To** list, which you use to select the file format suitable for the output device you select in the **Device** section. The file format selection determines the availability of some options in the process template. For this reason, you should select an output format before you set the other options in the process template.

Notes:

- If you are using TIFF Direct (Selecting **TIFF Direct** from the **Output To** list) and want to resend a job to output with different output process template settings, you should create separate output process templates for each case with different file naming conventions (**Processed File options** section > **Use Custom File Naming** check box and **Filename Template** box) and/or different device paths (**Device** section > **Device Path**).
- If you are using both TIFF Direct and standard TIFF connectivity, you should create separate output process templates for each type of connectivity with different file naming conventions (**Processed File options** section > **Use Custom File Naming** check box and **Filename Template** box) and/or different device paths (**Device** section > **Device Path**).
