About selecting one item

Use the **Select One Item** flow action to check conditions to extract a specific item from a set of items.

The item that meets the condition goes into the **Item** result. RBA ignores items that don't meet the condition. Actions that follow in the rule set are performed only on the selected item.

The most common use of **Select One Item** is when you use a page set event, such as **Page Set Full**, with the **Create Imposition** action. Since a job can have multiple page sets, use **Select One Item** to identify the specific page set that will be used for the imposition.

When you need to process all the items in a group, one at a time, use the **Split** flow action.
