

Sample: Make plates and automatically select the process template

Use the Make Plates - Auto-Select Process Template sample rule set to select a process template based on variables.

What the rule does

Selects a final output process template based on the imposition name. If the imposition name contains the string `press1`, then it uses the Press 1 process template. If the imposition name contains the string `press2`, then it uses the Press 2 process template, and so on.

Why it is useful

Automates the selection of a process template based on a variable that could be different every time the rule runs (in this sample, the variable is the imposition name).

Events and actions used

Event	Actions
Separation Approval Changed	Perform Final Output

Key parameters

Process Template Path: Create an assignment table. In the **If this is true** column, click the first row and select the variable that you want to use (for example, Imposition Plan Name Contains `Press 1`). In the **Then Process Template Path is** column, select the appropriate output process template for the press that this variable targets.

Where to enable it

This rule is suitable for enabling either in specific jobs or across the system.
