

About moving jobs between systems

You can move jobs to another Prinerger server or bring jobs in from another Prinerger server. The metadata and job history are moved but the job files remain on the job's home server.

You can move jobs between two Prinerger systems using the **Move Job From Server** action or the **Move Job To Server** action.

- The **Move Job From Server** action "pulls" a job from another Prinerger system and stores it on the Prinerger system on which you create the rule. This action operates the same way as the **Move Job from Server** menu item in Workshop.
- The **Move Job To Server** action "pushes" a job from the Prinerger system on which you create the rule and stores it on another Prinerger system. This action uses the **MoveJobToLocal** rule set on the target Prinerger system. This rule set ships with your Prinerger system and is located in the **Prinerger Systems** group in Rule Set Library. The **Move Job To Server** action is unique to RBA. You cannot use Workshop to move a job from your Prinerger system to a remote Prinerger system, except by exporting it.

How It Works

When you move a job or pre-job, the metadata and job history are moved but the job files remain on the job's home server.

If the job has rule sets enabled in it, the rule sets are automatically enabled on the target Prinerger system.

Note: If the rule is executing when the job is moved, execution is permanently stopped.
