

About submitting to digital presses

Use RBA to automate the creation of documents from files for submission to a digital print device.

In digital printing, a document combines content files (for example, PDF or variable-data print (VDP) files) with a job ticket (JDF file).

You can use RBA to prepare documents and target them for a digital production press using the following events and actions:

Use this event	To do this
Digital Submit event	Start the rule when files are submitted using the Prinergy Digital Submit software. A rule set that starts with the Digital Submit event must be enabled for the entire system.
Job Changed to Production event	Start the rule when files are moved to Production using the InSite Prepress Portal software or InSite Storefront software.
Job Hot Folder Drop event	Start the rule when files are dropped into a hot folder.
Manual Trigger event	Start the rule manually.
Use this action	To do this
Perform Loose Page Output action	Prepare a PDF or PostScript file to be used in a document.
Set JDF Intent action	Prepare a job ticket (JDF file).
Edit JDF for NexPress front end action	Prepare a job ticket (JDF file) specifically for the NexPress digital press. The job ticket is to be used in a document.
Create Document action	Combine a content file with a job ticket (JDF file) and target them for the print device.
Submit Document action	Send the created document to the digital print controller connected to the Prinergy system. You can change the order of the print queue.
Delete Document action	Delete the document to save disk space.
