Reading XML from other software

You can use the **Read XML** action to gather information from other software, such as an ecommerce site or a management information system (MIS).

If you want Prinergy to read XML files generated by other software and to process jobs based on that information, do the following steps:

- 1. Create or obtain a schema and add it to the Prinergy system using XML Schema Manager.
- 2. Create a rule set.
- 3. Use a **Job Hot Folder Drop** event to start the rule set.
- Add a Read XML action, set the parameters, and click OK.
 In the File row, click . On the Event Properties tab, in Hot Folder Path, select Directory Name.
- 5. Add all of the subsequent actions that you want, such as the **Add Input Files** action, the **Refine Input File** action, and so on.
- 6. Save, close, and enable the rule.
- 7. Drop a sample XML file into the hot folder to test the rule.
