

# Exporting a rule set's execution history

Create a `.zip` file containing all of a rule set's execution history data that you can send to another site for importing and further analysis.

1. Open the rule set whose execution history you want to export in Rule Debugger.  
Select the desired rule set in the **Rule Set Library** list or the **Enabled Rule Sets** list, and select **File > Debug** or click **Debug** .
2. Perform one of the following actions:
  - To export one execution of the rule set, select the desired execution in the **Rule Set Execution History** pane, and select **File > Export This Execution**.
  - To export multiple executions of the rule set, select **File > Export Multiple Executions**. In the Rule Set Execution History dialog box, select the check boxes for the executions that you want to export, and click **Export**.

**Tip:** Click the check box for a specific date to select all executions that occurred on that date.

3. In the Export dialog box, type a name for the `.zip` file, select the location where the file will be saved, and click **Save**.  
If you are exporting multiple executions, the data for all executions will be included in one `.zip` file.  
The Import Export Manager dialog box displays the export progress.

After the `.zip` file has been created, you can retrieve it and send it to another site for importing—for example, in an e-mail message or using an FTP site.
