Exporting and importing rule set execution history

Export a rule set's execution history so that someone else can analyze the history to determine why a rule set did not execute successfully. Import a rule set's execution history to analyze its history in your Rule Debugger.

You can export a rule set's execution history to another site so that someone else can analyze the information. For example, you might want to send the data to a Kodak service representative for diagnosis, to determine why a particular execution of a rule set failed. You can export one execution of a rule set or multiple executions of a rule set.

When you export a rule set's execution history, a `.zip` file containing all of the data is created in the location that you specify. You can then send the `.zip` file to another site as desired—for example, in an email message or using an FTP site.

When you import a rule set's execution history, you use the `.zip` file that was sent to you. Importing a rule set's execution history is a two-step process. First, you import the rule set, and then you open the rule set in Rule Debugger and import the rule set's execution history.

Note: You can also press CTRL+C to copy RBA parameters from the Rule Debugger onto the clipboard.
