

# Marks tab

## Do not use in marks

You can configure PLA to automatically exclude certain colors from being used in marks. This is especially useful for marks that you want to be printed in the darkest color in the job. When PLA evaluates the colors in use within the job, it will ignore these colors.

- In the **Colors** area, type the colors to be excluded using a semicolon as a separator.  
**Note:** Do not include any spaces before or after the semicolon. For example, type the following: `UV;Varnish;Die;Dieline;Gloss`
