Driving Prinergy with XML from other software

You can use XML from other software—such as an eCommerce site, MIS system, or planning system—to drive Prinergy Workflow using RBA. For example, each time a customer places an order at an eCommerce site, the web site can generate an XML file identifying the order details. When the XML file appears in a Prinergy hot folder, RBA can use the data in it to create a job, refine the input file, and print the job.

- Reading XML from other software
- Setting up a schema
- Creating a rule to process jobs based on XML data
- Creating a rule that creates jobs based on XML data
