

VPS+ 9.5 Release Notes

About VPS+ 9.5

VPS+ has been refactored for performance, quality, and memory handling.

Previews are created with fixed zoom levels to speed up rendering and viewing, and view quality is now identical to VPS Classic.

VPS+ can now open many sets of impositions (Fronts and Backs) simultaneously.

VPS+ New Features

macOS 12 Monterey support

Macintosh M1 processor support

Compatibility with Azure Windows Virtual Desktop

Users can open VPS, TIFF or LEN files for preview or reformatting. (In VPS Classic, only VPS files could be opened and viewed).

VPS+ Bug Fixes

VPSPPLUS-295 Front and back pages of Work and Turn forms don't align in some cases

VPSPPLUS-292 Front and Back pages of Perfector layouts don't align in some cases

VPSPPLUS-286 Color densitometer not accurate for Black, depending on Zoom level

VPSPPLUS-285 Angles measured with the measure tool are inaccurate

VPSPPLUS-209 Double-byte characters not support for Job Name or Imposition Name

VPSPPLUS-8 VPS+ crashes when opening LEN files

VPS+ Limitations

There is no **Ink Coverage Comparison** features, as in VPS Classic.

Cannot preview two-sided layouts in Packaging Mode. Flexo packaging layouts typically created from TIFFs files, and TIFFs cannot contain the DIG comments required to recognize imposition information.

Long color names are cut off in the Separations panel, which can make it difficult to identify PANTONE colors. **Workaround:** hold the mouse pointer over the color separation name, and a Tool Tip pop-up with the full color name will appear.

The **Navigator and Inventory/Separations panels are fixed to the right side of the VPS+ display window** and cannot be resized, so panels cannot be enlarged to view long color names and the maximum Zoom to Fit size of layouts is constrained.
