Using wild cards in file names

When you refer to file names in RBA parameters, you can use the basic wild card characters *
and ?.
You can use wild cards when specifying file names in actions that use files—for example, the
Copy or Move Files, **Email**, and **Delete Files** actions.

- The asterisk (*) substitutes for zero or more characters.
- The question mark (?) substitutes for any single character.

The syntax is the same as in Microsoft Windows.
Some examples of wild card characters in file names include the following:

- `*.txt` applies the action to all files ending in `.txt`.
- `file.p*` applies the action to all files starting with `file.p`.
- `??????.pdf` applies the action to all PDF files with six characters in their names.
