Selecting one item from a set

Add a **Select One Item** flow action to a rule to send a single item from a group on to the next action, when that action requires a single item.
For example, use **Select One Item** to select one page set for the **Create Imposition** action.

1. Create or open a rule set with at least one event and one action.
   For example, create a rule set where the **Page Set Full** event starts the **Create Imposition** action.
2. On the **Flow** tab, drag **Select One Item** to the line between the event and action.
   By default, the action is now connected to the ☑ **Item** result of **Select One Item**.
3. Double-click the line between the event and **Select One Item**.
4. In Filter Editor, click ⊖ . In this specific situation, you do not need to set any conditions.
5. Save, close, enable, and test the rule set.
