

Multiple Prinerger systems

When you have more than one Prinerger system, you can use Administrator software remotely but you cannot share secondary servers.

Using Administrator software remotely

You can use Administrator software on one primary server to connect to the Administrator software on another primary server.

Secondary servers

You cannot share secondary servers between Prinerger systems. When you install the Prinerger Server software on a secondary server, the secondary server is associated with a specific primary server and a specific Prinerger system. If you want to add a secondary server to a different Prinerger system, you must first remove the secondary server from the original Prinerger system.

Using Prinerger Dashboard to view jobs on multiple Prinerger servers

Prinerger Dashboard can show the status and progress of jobs on multiple Prinerger servers. You can set up Dashboard to view job status on multiple Prinerger servers.
