# Matchprint Virtual preview

If you are using Macintosh ColorFlow client with Matchprint Virtual Software installed, you can preview an image with accurate display color on a Matchprint Virtual qualified monitor.

Before you can preview with Matchprint Virtual, you must do the following:

- Change the display profile to a Matchprint Virtual profile in the **Preferences** > **ICC Profiles** tab
- Calibrate your monitor every 24 hours by clicking the **Calibrate** button in the **Image Preview** dialog box.

Note: Matchprint Virtual is a licensed software and its license is controlled by the InSite Prepress Portal, InSite Creative Workflow, or PressProof Software.

The following image shows an example of a Matchprint Virtual preview:

1	Calibrate button
2	Matchprint Virtual status: • Red — the monitor has never been calibrated • Yellow — the monitor was previously calibrated, but requires recalibration • Green — the monitor is calibrated
