About color targets 1

Your PressProof administrator imports ICC color profiles that match your hard copy proofing system into the PressProof system as color targets. A color target is an ICC profile that your monitor can achieve.

The administrator assigns a color target to each surface that is viewed in PressProof. To determine which color target is assigned to a particular surface, view the surface in Window mode. The color target appears at the bottom of the information pane, on the left.

Note: The color target name will only display after you open a surface for viewing. If no surface is selected, the color target will be blank.

If the color target for a surface is missing or incorrect, contact your system administrator.
