Editing bleeds for rectangular work

When you place an artwork file in the layout, the Pandora software creates a rectangular bleed path that is offset from the PDF trim box by the amount you specified in the **Bleed margins** box in **Preferences**. The black handles on a selected artwork identify the trim box. You can modify bleed paths on the **Geometry** palette, as needed.

1. With the artwork selected in the layout, click the **down** arrow on the **Geometry** palette to display the lower panel.
2. Under **Bleed margins**, click the box that corresponds to the artwork side for which you want to edit the bleed.
3. Type the new bleed margin size, and press the Tab key.
4. Repeat steps 2–3 for each bleed you want to edit.
5. If you need to make a change, select the artwork, and select **Object** > **Revert Bleedpath** to return to the default bleeds.
