

Exporting a device condition profile

You can export a device condition profile from ColorFlow to use it in a non-integrated workflow or in external software.

Note: You do not need to export any color control elements in order to use them in Prinergy.

1. Click the border of the device condition.
2. Select **Export > Device Profile**.
3. If you are exporting the device condition profile for a PCO or SCO that uses simulation or conversion curves, you can include the effect of the curves in the exported device profile by clicking **Yes** in the dialog box appeared.
4. Save the profile file.

The device profile is saved as an .icc file.
