Prinergy prepress workflow connector

Use the **Configuration** tab to set up communication between the Business Link software and the Prinergy server, and to define where and how Prinergy creates and names the jobs.
Note: If the MIS uses Kodak JDF extensions for Business Link to provide values for the same options that you set in the **Configuration** tab, the MIS values will take precedence. For more information, see the MIS documentation.

- Configuring the Prinergy workflow connector
- Prinergy job name format
