Using built-in reports

The Business Link database holds Prinergy job data for reporting purposes, including details of job processes and the status of affected elements. Business Link also collects information about Prinergy job events such as change requests and page approvals that are initiated via the Kodak InSite Web portal, if used. You can generate various built-in Prinergy production reports for up-to-date information about materials and resources that were used on a job in Prinergy, any alterations that were made to it, and overall system usage. Several sample reports are provided here.
