

Adding a mark to a job

You can add any mark on the **Marks** palette to a job.

There are individual icons for these types of marks: SmartMark, simple mark, and editable text mark.

1. If the **Marks** palette is not currently shown, select **Window > Show Marks Palette**.
2. On the **Marks** palette, double-click the folder that contains the mark, then click the mark to select it.
3. Drag the mark to the desired location in the layout.
Note: If there are no colors in the job or if the mark is an unbound die station mark, it may not appear on the layout.

After adding a mark to a job the first time, you can add it again by dragging it into the layout from the **Marks** palette, or by dragging it from **job properties**. Information about the selected mark is displayed under **Attributes** on the **Content** tab of **job properties**.
