

Editable text marks

Editable text marks contain placeholders for text. You can place them anywhere on a substrate. The mark color is derived from the color set in the PDF file. The only difference between an editable text mark and a label mark with variable text is that with an editable text mark, you can modify the text in the **layout** view using the Mark Properties dialog box, or from the **Content** tab of **job properties**.

You can modify the text, font name, style, size, color, and overprint state of label marks on the **Content** tab of **job properties**, or by double-clicking or right-clicking (Ctrl+Click) the mark and selecting the Mark Properties dialog box. You can have separations of a mark print in reverse, for example, when using the Pandora mark `Micro Dot.pdf`. You cannot modify the crop box of the mark in Pandora.

The Pandora software includes the editable text mark **LBL_Text**, but you can also create your own. The placeholder text for the editable text mark must always be `<Text>`, and will not be visible when you add it to the layout.
