

# Center marks

All center marks exist as a single tick or shape. The software centers the mark on the bottom edge of the substrate, then rotates a copy of the mark by 90 degrees and centers it on the right edge of the substrate. Finally, Pandora rotates two more copies of the mark, and centers them on the top and left edges of the substrate.

CTR_Center_Cross.pdf	A cross with a long vertical axis
CTR_Center_Pinhead.pdf	Appears at the center of all four edges of the substrate, extending inward in the shape of a pin with a head
