

Setting up RBA to read the InSite XML files

You can create a simple RBA rule that reads the XML files produced by the Prepress Portal software, and then sends the data to the PLA software to create a layout.

To read the XML file as soon as it is created in Prepress Portal, you must use the **InSite Info Sheet updated** event to trigger the actions in the rule, even though RBA rules that are used in PLA normally begin with the **Layout Automation Job Created** event.

The following rule will read Prepress Portal XML files and create a layout based on the XML data:
