

Adding the schema to RBA

You must add the schema (XSD) file that you created for info sheets to RBA using the XML Schema Manager. Then, you associate it with the XSLT file that you created to translate the info sheet XSD file into the PLA format.

1. In Workshop, select **Tools > Rule Set Manager**.
2. In Rule Set Manager, select **Tools > RBA XML Schema Manager**.
3. Click **Add a Schema**, and perform the following steps:
 - a. In the **Name** box, give your schema a distinctive name so that it is easy to find.
 - b. In the **Schema File** box, locate the XSD file that you created for InSite info sheets.
 - c. In the **Transform File** box, locate the XSLT file that you created to translate InSite XML to the PLA format.
 - d. Click **Add Schema**.
4. Check that your schema is working correctly in RBA:
 - a. Obtain a sample XML file.
If you created sample XML files during the configuration of Prepress Portal, you can use the latest version located in your test job `Control` folder at
`\\<jobserver>\Jobs\<Job>\Control\VersionedJobInformationSheets\<Version-Id>`.
 - b. In RBA XML Schema Manager, click **Test** next to the name of the schema that you added.
 - c. Test your schema against the InSite XML file, and make sure that the values appear in the correct fields and that RBA reads the file successfully.
