

Distilling page and sheet mark PostScript files to create PDF files

In Preps software, when you print a mixed PostScript, populated job ticket format (PJTF), or job definition format (JDF) file, Preps also prints a marks PostScript file. As Prinergy Evo accepts only PDF files for output imposition process template, if you plan to submit the marks file to Prinergy Evo along with the PJTF or JDF file, you must first refine or distill the marks PostScript file to create a PDF file before you submit your imposition files for output.

During installation, the Client installation supplied you with a pre-configured `Prinergy Marks.joboptions` file. Use the following procedure if you need to re-configure the job options settings:

1. To configure Distiller 5.x software using the recommended Acrobat Distiller settings for page marks, sheet marks, and Preps marks, from the **Settings** menu, select **Job Options**.
2. In the Job Options dialog box, click **Save As**, and save the configuration as `Prinergy Marks.joboptions`.
3. To select the recommended Prinergy Evo settings, in the Acrobat Distiller window, in the **Job Options** list, select `Prinergy Marks.joboptions`.
4. Drag files to be distilled onto the Acrobat Distiller dialog box.

Refer to Distiller's **Acrobat Guide** (from the **Help** menu, select **Acrobat Guide**) for more information.

Note: If your customers have Distiller software, you can give them the recommended settings file to use on their own computers. Distribute the following file and have your customer put the `PrinergyMarks.joboptions` file in the `Adobe Acrobat x.x\Distiller\Settings` folder.
