

PageMaker best practices

- To use Prinergy Evo's trapping or color matching features, you must create composite PostScript input files.
- When printing PostScript, you should select a printer driver and PPD that support color devices. Prinergy Evo supplies a Refine PPD that meets this criteria (Prinergy Refiner.ppd), which you installed during the Prinergy Evo Client software installation. Use a LaserWriter printer driver version 8.5.1 or newer.
- Include registration marks when preparing your PostScript files. In the Print Document dialog box, click **Paper**. Select the **Printer's marks** and **Page information** check boxes. In the **Paper size** box, select **Custom**. A new paper size that allows for the marks is displayed in the Custom Paper Size dialog box.
- Prinergy Evo software determines the trim box from crop mark information supplied in PageMaker 6.0, 6.5, and 7.0 PostScript files that include registration marks.
- We recommend that you always include or embed fonts in PostScript files.
