

Setting OPI replacement image paths

The image search path specifies the location of the high-resolution images for the file. Prinergy Evo software uses the image search path when images for the file are NOT embedded in the input files.

OPI paths can be used to search within local folders, mapped drives, or network locations that Prinergy Evo software has permission to access.

If your input file's images are located in two or more folders, in Prinergy Evo software add a search path for each image folder and then specify the order that you want Prinergy Evo software to search the folders. OPI image paths can be relative.

1. See [Creating a refine to PDF process template](#).
2. In the **Normalize** section, **Images** area, select the **Do OPI Replacement** check box.
3. In the **Search Path Order (from top to bottom)** box, type the images folder directory path. For example: `/Images/Jobxyz/`.
4. Click **Add** to add the images path to the list in the **Search Path Order** list.
