

Where do refined output files go?

If the input file was submitted for refining using a hot folder, Prinergy Evo software creates a PDF file and stores the file in the hot folder processed folder.

If the input file was submitted via the Template Palette, Prinergy Evo saves the refined file to the input file's original folder.

When the system refines a multi-page input file, it either creates a single PDF or, if specified, splits the input file by page. Prinergy Evo software then names the PDF files it creates as follows: `filename.p0001.pdf`, where `p0001` is the page number, enabling you to sort your pages in numeric order. For example, if the two-page `test.ps` is refined, the system creates `test.p0001.pdf` and `test.p0002.pdf`. If the same file is re-refined, the system overwrites those files. Prinergy Evo will not overwrite the source input file.
