

Using raster color management

Raster color management calculates the correct color balance for each pixel in a file. This is a very processor-intensive activity and can significantly affect file throughput speed.

Raster color management works only with continuous tone images. It does not work for screened output. It is suitable for proofing, but not for plating.

1. [Create an output process template.](#)
2. From the **Output To** list, select an appropriate format.
3. In the **Match Colors** section, select **Overprint Handling**.
4. From the **Method** list, select **Raster**.
5. Save the process template.
