

# Using vector color management

Vector overprint handling color matches the overprint areas by creating a new vector object for each area of overlap. It matches the color of this new vector object as a separate entity and is significantly faster than raster color management.

Vector color management can be used for both proofs and plates.

**Note:** This is a licensed feature. Vector color management is one of the features available as part of the Proof Color Management package.

1. [Create an output process template.](#)
2. From the **Output To** list, select an appropriate format.
3. In the **Match Colors** section, select **Overprint Handling**.
4. From the **Method** list, select **Vector**.
5. Save the process template.
