

IS Screening

Maxtone IS (Irrational Tangent Screening) is used for specialized imaging purposes, such as seamless flexographic sleeves and cylinders, direct cylinder engraving, and gravure imaging applications.

This is a specialty screen that images much slower than conventional screens. You can use this type of screen when outputting to devices such as Kodak ThermoFlex Wide II digital flexo imagers or third-party gravure imaging devices.

Kodak IS screening is a licensed feature. For a complete list of the advantages and limitations of using IS screening, see the Prinergy Workflow Help.
