

Creating an Araxi service account on a UNIX server

Create a user account that the Araxi service uses to access the UNIX server.

1. Create a user account for the Araxi service and give it the name **Araxi**.
2. Give the user account full permissions to the directory being shared and to all files and subdirectories under it. Use either of the following methods:
 - Add the user account to a group that has the required permissions, such as the local administrator group.
 - Give the permissions directly to the user account.

For information about assigning permissions in UNIX, see the UNIX documentation.
