

Multiple Prinergy systems

When you have more than one Prinergy system, you can use Administrator software remotely but you cannot share secondary servers.

Using Administrator software remotely

You can use Administrator software on one primary server to connect to the Administrator software on another primary server.

Secondary servers

You cannot share secondary servers between Prinergy systems. When you install the Prinergy Server software on a secondary server, the secondary server is associated with a specific primary server and a specific Prinergy system. If you want to add a secondary server to a different Prinergy system, you must first remove the secondary server from the original Prinergy system.
