

Limitations of protocol conversions using Network File Shares Configuration

Carefully plan and set up file-sharing protocols so that you don't have to convert protocols. Using Prinerger Administrator's Network File Shares Configuration to convert file-sharing protocols has several limitations.

Prinerger Administrator does not convert file resources information. To retain file resources, you must perform additional steps to convert file resource information.

- If you have a job volume on a Windows server, use the Fork Translator utility to convert file resource information. See [Changing file resource information with Fork Translator](#).
- Use Fork Translator utility to convert file resources information in the AraxiPreps share on the primary server. See [Changing file resource information with Fork Translator](#).
