

About Adobe PageMaker

- Composite PostScript is required if you want to use Prinergy's trapping or color matching features.
- When printing PostScript, you should select a printer driver and PPD that support color devices. Prinergy installs a PPD with Workshop that meets this criteria (**Prinergy Refiner.ppd**). You should use a LaserWriter printer driver version 8.5.1 or newer.
- You should include registration marks when preparing your PostScript files. In the Print Document dialog box, click **Paper** . Select the **Printer's marks** and **Page information** check boxes. In the **Paper size** box, select **Custom** . A new paper size that allows for the marks is displayed in the Custom Paper Size dialog box.
- Prinergy determines the trim box from crop mark information supplied in PageMaker 6.0, 6.5 and 7.0 PostScript files that include registration marks.
- Always include or embed fonts in the PostScript files.
