

Raster-separated data

Formatting raster-separated data to use with Workshop and Pandora

Using Copydot Toolkit Pro, format raster separated data for use in Workshop or Pandora. You can format 1-bit TIFF, Raster DCS, and Copydot input files.

1. Merge dielines to artwork in Copydot Toolkit: When dielines are received in a separate file, merge them to the artwork.
Optional: If necessary, correct the dieline Orientation in Copydot Toolkit.
2. Set the trim box in Copydot Toolkit: Set the trim box and bleed to match the margins for the artwork.
3. Reformat TIFF files as a high-resolution PDF in Copydot Toolkit: Reformat TIFF files to a high-resolution PDF format.
4. Refine input files manually: Refine the prepared high-resolution PDF in Workshop.
Note: You must use a refine process template that generates thumbnails.
